EDUCATION

Bachelor of Philosophy – Science (Honours)

2021

- Australian National University
- Major: Mathematics
- Thesis: Deligne-Lusztig theory and character sheaves
- GPA: 7.00 (out of 7.00)
- Queensland Certificate of Education

2017

- Brisbane Grammar School
- ATAR: 99.90

AWARDS and COMMENDATIONS

Scholarships

(i) National University Scholarship (\$12,500 per annum for 4 years) 2018-2021

- (ii) College of Engineering & Computer Science Research & Development Excellence Scholarship (\$5,000)
- (iii) Bachelor of Mathematical Sciences Relocation Grant (\$1,000)
- (iv) Mathematical Sciences Institute Honours Scholarship (\$5,000) 2021
- Dean's Science Education Commendation Award
 2019 / 2020
- Chancellor's Letter of Commendation
 2018 / 2019 / 2020
- Cockle Prize for Dux of Mathematics
 2017
- General Merit Award

PREVIOUS EXPERIENCE and LEADERSHIP ROLES

Demonstrator for MATH1005, MATH1013, MATH1014, MATH1115, MATH2322 at the
 Australian National University

President of ANU Mathematics Society 2020

Secretary of Undergraduate Student Research Society (formerly PhB Society)

Summer Research Scholar
 2019 / 2020

• First-year Drop-In Mentor

Sponsorship Officer for ANU Mathematics Society

Peer-Assisted Learning Mentor for MATH1005, MATH1116
 2019

Internship – Data Analyst at LGIAsuper
 2018 / 2019

• Internship – Junior Quality Assurance Officer at Fugro Roames Pty Ltd 2015 / 2016

PREVIOUS RESEARCH and SPECIAL TOPICS

Project Title	Description	Supervisor
Crystals: Combinatorial	In this lecture course, we developed the theory of	Dr. Noah White
Algorithms and Tensor	monoidal categories, with a focus on braided and	
Categories	coboundary monoidal categories. We also studied	
	the induced actions by the braid and cactus groups,	
	with a focus towards constructing interesting	
	examples of these actions.	
	To motivate the definition of a crystal, we defined	
	reflection groups and root systems before proving	
	various results, such as the classification of	
	irreducible finite real reflection groups.	
	In the final part of the course, we constructed	
	crystals and used combinatorial algorithms to	
	compute their various properties, with a focus on	
	the crystals of semistandard tableaux for the (GL_n)	
	root datum. More precisely, we studied the RSK	
	algorithm, the Schützenberger involution and the	
	Littlewood-Richardson coefficients.	
Algebraic & Analytic	This reading course was devoted to various topics in	Dr. Amnon Neeman
Number Theory	modern number theory. The first half was devoted to	
	algebraic number theory and various standard	
	results, such as the Kummer-Dedekind theorem,	
	Minkowski's bound and methods of computing the	
	class group. We then spent some time analysing	
	techniques specific to Galois extensions of number	
	fields.	
	For the second half, we transitioned into analytic	
	number theory, proving results such as the prime	
	number theorem and the analytic class number	
	formula. I gave a lecture proving the Chebotarev	
	density theorem, as well as Frobenius' theorem and	
	the Dirichlet density theorem (which can be derived	
	as corollaries).	
Riemann Surfaces	This lecture course developed much of the	Dr. Ian Le
	important theory for Riemann surfaces, including	
	the uniformization theorem, the existence of	
	meromorphic functions on any compact Riemann	
	surface, the classification of elliptic curves and	
	more.	

personal project, I wrote a short paper	
nonstrating the equivalence of the Čech, de	
m and Dolbeault cohomologies on any complex	
nifold. I then used this to give an alternate proof	
ne existence of meromorphic functions on	
npact Riemann surfaces, different from the one	
n in lectures.	
course was a broad survey of many topics in 3-	Dr. Joan Licata
nifold theory, including Heegaard	
ompositions, surgery, Morse theory and more. It	
intended to provide an introduction to many	
erent areas, with the goal that students might	
e the language to research any interesting topics	
her.	
a personal project, I gave a talk and wrote a short	
er about the construction of Khovanov homology	
knots. I also proved that it was invariant under	
first and second Reidemeister moves.	
reading course developed the background	Dr. Uri Onn
essary to understand Tate's seminal thesis,	
ch used techniques from representation theory	
rove the meromorphic continuation of zeta	
ctions on locally compact abelian groups.	
reading course followed Ravi Vakil's <i>The Rising</i>	Dr. Anand Deopurkar
: Foundations of Algebraic Geometry to develop	
theory of sheaves and schemes. The first half	
used on the equivalence between rings and affine	
emes, while the second was built around	
sicoherent sheaves, line bundles and sheaf	
omology.	
course developed the theory of vector bundles	Dr. Vigleik Angeltveit
a topological space, defining topological K-	
ory and showing its applications.	
a personal project, I constructed an alternate <i>K</i> -

bry for analytic objects called C^* -algebras. I also wed the Serre-Swan theorem, which shows that blogical K -theory is a special case of operator K -bry of C^* -algebras. The course gave a computational approach to dern algebraic geometry, developing algorithms	Dr. Martin Helmer
	a personal project, I wrote a short paper nonstrating the equivalence of the Čech, de am and Dolbeault cohomologies on any complex nifold. I then used this to give an alternate proof the existence of meromorphic functions on a pact Riemann surfaces, different from the one in in lectures. Is course was a broad survey of many topics in 3-nifold theory, including Heegaard compositions, surgery, Morse theory and more. It is intended to provide an introduction to many terent areas, with the goal that students might the the language to research any interesting topics her. In a personal project, I gave a talk and wrote a short the about the construction of Khovanov homology knots. I also proved that it was invariant under first and second Reidemeister moves. Is reading course developed the background essary to understand Tate's seminal thesis, ch used techniques from representation theory prove the meromorphic continuation of zeta actions on locally compact abelian groups. Is reading course followed Ravi Vakil's The Rising to Foundations of Algebraic Geometry to develop theory of sheaves and schemes. The first half used on the equivalence between rings and affine the emes, while the second was built around assicoherent sheaves, line bundles and sheaf nomology. Is course developed the theory of vector bundles a topological space, defining topological K-pory and showing its applications.

	T	
	As a personal project, I studied the invariant theory	
	of finite matrix groups, culminating with the	
	Chevalley-Todd-Shephard Theorem. This theory has	
	direct applications to the representation theory of	
	finite groups of Lie type.	
Perverse Sheaves &	This formal lecture course was divided into two	Dr. Asilata Bapat &
Deligne-Lusztig Theory	sections. In the perverse sheaves component, we	Dr. Uri Onn
	developed the theory of derived categories and t -	
	structures on a triangulated category. We used this	
	to study perverse sheaves and the perverse t-	
	structure induced by a perversity function.	
	The Deligne-Lusztig component was devoted to	
	various classifications for characters on finite	
	reductive groups, including parabolic induction and	
	Deligne-Lusztig induction.	
Applications of Persistent	I used techniques from the field of persistent	Dr. Katharine Turner
Homology to Identifying	homology to develop an algorithm to identify bridges	
Bridges in Graphs	in graphs. This algorithm has applications in	
	identifying diffusers of malicious information	
	through social media.	
Differential Geometry and	I followed the text Calculus on Manifolds by Michael	Dr. Ben Andrews
de Rham Cohomology	Spivak to learn the elementary theory of differential	
	geometry. Ben Andrews provided resources to	
	extend the project into the topics of Riemannian	
	metrics and de Rham Cohomology.	
The Implementation of	I investigated the mathematical theory of inner	Prof. Scott Morrison
Inner Product Spaces in	product spaces and Hilbert spaces in the context of	
Lean	implementing this theory in the interactive theorem	
	proving language Lean. I developed the rudimentary	
	theory, including implementing the axioms of an	
	inner product space, and proceeded to prove results	
	such as the Jordan von Neumann Theorem, the	
	Orthogonal Decomposition Theorem and the Riesz-	
	Representation Theorem.
